2. CERTIFICATION INFORMATION

Description of product certification

This product certification is for bricks and pavers manufactured at Austral Bricks (Tas) Pty Ltd's Longford site (Figure 1). At this site Austral Bricks produces a range of bricks and pavers for the Tasmanian, other Australian markets and overseas markets.

- Functional unit: tCO₂-e/1,000 Standard Brick Equivalents (SBEs) of bricks or pavers
 manufactured in Longford and used in various applications throughout Tasmania, interstate and
 overseas.
- Offered as: full coverage product
- Life cycle: cradle-to-grave

The responsible entity for this product certification is Austral Bricks (Tas) Pty Ltd, ABN 83 125 934 947.

This Public Disclosure Statement includes information for FY2023-24 reporting period.

Brickworks is currently working towards producing EPDs for our Australian made products. An EPD was not available at the time of producing this PDS. The carbon inventory has been prepared and verified based on the Climate Active Carbon Neutral Standard for products and services, the ISO14040:2006 and ISO14044:2006 standards for life cycle assessment.

Description of business

Brickworks Limited (Brickworks) is one of the Australia's leading providers of building products. Austral Bricks, a subsidiary of Brickworks has been transformed from originally a New South Wales state based operation to a national organisation with manufacturing operations in NSW, Victoria, Tasmania, South Australia, Western Australia and Queensland. Austral Bricks manufactures and markets clay products such as bricks and pavers. The manufacturing process involves mining clay and shale and mechanically processing it prior to shaping and firing the

bricks in kilns fuelled predominately by natural gas.

Austral Bricks Longford, Tasmania operates a low carbon operation whereby the kiln is predominately fired by sawdust. It has manufactured carbon neutral bricks since 2013/14 under the Climate Active Standards.

3.EMISSIONS BOUNDARY

Inside the emissions boundary

All emission sources listed in the emissions boundary are part of the carbon neutral claim.

Quantified emissions have been assessed as 'attributable processes' of a product or service. These attributable processes are services, materials and energy flows that become the product or service, make the product or service and carry the product or service through its life cycle. These attributable emissions have been quantified in the carbon inventory.

Non-quantified emissions have been assessed as attributable and are captured within the emissions boundary, but are not measured (quantified) in the carbon inventory. All material emissions are accounted for through an uplift factor. Further detail is available at Appendix C.

Outside the emissions boundary

Non-attributable emissions have been assessed as not attributable to a product or service. They can be **optionally included** in the emissions boundary and therefore have been offset, or they can be listed as outside of the emissions boundary (and are therefore not part of the carbon neutral claim). Further detail is available at Appendix D.

4.EMISSIONS REDUCTIONS

Emissions reduction strategy

Brickworks is committed to social and environmental responsibility. As a large and diverse building products manufacturer, we believe we have a responsibility to our shareholders, employees, industry, environment and the wider community. Brickworks accepts responsibility for environmental protection which is integral to the conduct of its commercial operations. Brickworks' key objective is to comply with environmental laws and regulations which relate to its environmental aspects and minimise environmental harm by operating in a manner that reaches an appropriate balance between environmental, technical, economic and social objectives. We recognise that all employees have a major role to play in protecting the environment. To achieve our environmental policy commitments, the company will actively provide for, encourage, and support training in environmental issues and sustainability.

As a subsidiary of Brickworks Limited, Austral Bricks Tasmania has the backing of professional teams in environment, sustainability and research and development. Brickworks' sustainability strategy, 'Build for Living: Towards 2025', recognises the substantial environmental and social impacts of the built environment. The strategy focuses on the opportunity to make buildings and cities safe, resilient and sustainable through reducing carbon emissions. The strategies are available on Brickworks' website: https://www.brickworks.com.au/sustainability/ and https://www.brickworks.com.au/climate-related-impacts-and-responses/.

Last year Brickworks announced a new carbon target: to achieve 15% reduction in Scope 1 and 2 greenhouse gas emissions by 2030, from a 2022 baseline, across our combined Australian and North American operations. In response to the subdued market conditions, the Company has taken the opportunity to carry out increased maintenance activities and intermittent plant shutdowns during FY2024, ahead of the anticipated strong demand through the rest of the decade. This has influenced a reduction in greenhouse gas emissions in FY2024 of 22% compared to the FY2022 baseline.

The carbon target is also underpinned by our stretch target for a 10% increase in gas efficiency at Austral Brick plants by 2030 since FY2018. Since FY2018, which marked the start of a strategic 10-year investment vision to drive energy efficiency, our Austral Bricks business has seen an 8% improvement in gas efficiency.

Renewable bioenergy generation also offers the potential to generate carbon offsets on-site, from emission reduction activities such as the diversion of organic waste from landfill. Brickworks has over 10 years of experience in providing carbon neutral products from our Longford Tasmania facility.

Longford uses 73% bioenergy of the site's energy mix, which has avoided over 70,000 t CO2-e in emissions over 10 years. Residual 50,000 t CO2-e of emissions from the lifecycle of brick manufacture and sales from Longford have been offset over the last 10 years. We seek to replicate the success of this low brick carbon manufacturing process across Brickworks sites.

According to estimates by the Australian Renewable Energy Agency, bioenergy could account for 33% of the industrial heat processing needs by 2030. We are actively advancing various feasibility studies for a

series of projects designed to significantly boost the utilisation of bioenergy. These opportunities encompass harnessing additional landfill gas resources, integrating alternative organic raw materials, and generating on-site bioenergy through anaerobic digestion.

Brickworks will use our product strengths to develop the next generation clay brick and concrete block wall systems. Our sustainable product innovation strategy focus is to provide a wide range of thermal mass product options with high recycled content and lower embodied carbon across roofing and walling products. By 2030, Brickworks and our partners will invest over \$22.6 million into research and development into our sustainable innovation focus areas including: the thermal mass benefit of products, light-weighting, raw material optimisation to reduce embodied carbon and increase recycled content, sustainable design elements and product innovation.

Climate Related Strategy and Programs

In Australia, Brickworks Limited carbon emissions have followed a general downward trend, with a 56% decrease in FY2024 compared to the base year 2005/06 (Scope 1 and 2).

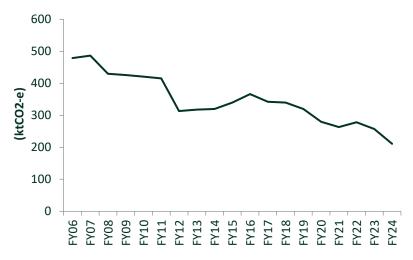

Figure 1. Brickworks Building Products Australia Greenhouse Gas Emissions Since 2005 (ktCO2-e)

The decrease is attributed to efficiencies gained from alternate fuels, manufacturing consolidation, equipment upgrades and operational improvements. Brickworks has invested over \$400 million dollars since 2006 in equipment upgrades and operational improvements (including new plants) and carbon reduction strategies.

Our climate-related strategy, targets and programs build on these achievements, focusing on four key areas, including efficiency, lower carbon energy sources, innovation and improving the energy efficiency of homes over lifetime operations. Each focus area has deliverables to drive performance as referenced below.

Brickworks climate related strategic focus areas and deliverables

	Manufacturing energy efficiency strategy	Lower Carbon Energy Sources	Innovation	Improve home energy efficiency over lifetime operations
Strategy focus area	Achieve global leadership in leading manufacturing excellence and efficiency	Increasing use of bioenergy and low carbon fuels Renewable Electricity and Gas Purchasing Strategy	Develop the next generation clay brick and concrete block wall systems, through light- weighting, on-board fuels, raw material optimisation and product innovation	Provide thermal mass products such as bricks and roof tiles which can reduce heating and cooling bills by up to 40% annually using cavity brick compared to lightweight construction ¹
Deliverables	Stretch target for 10% increase in gas efficiency at Austral Bricks plants by 2030 (FY2018 baseline)	15% reduction in Scope 1 and 2 greenhouse gas emissions by 2030, from a 2022 baseline, across our combined Australian and North American operations Continued investment into developing feasible renewable biomethane opportunities Bioenergy Transformation Strategy Complete the Brickworks Hydrogen Project	Year on year increase into R&D investment into the next generation of clay brick and concrete block wall systems. This represents more than \$22.6 million invested by 2030 by Brickworks and our partners Share learnings and explore opportunities with value chain Increase the volume of verified sustainable products to 25%	Invest in research for thermal design and lifecycle education Share learnings and explore opportunities with value chain

Sawdust is the main fuel source at Austral Bricks Longford, Tas and is a waste acquired from various Tasmanian sawmills. The site used 119,000 GJ of sawdust throughout the year. While the use of sawdust is less energy efficient than natural gas, its bioenergy component means that net carbon emissions from the combustion of sawdust is 40 times lower than natural gas avoiding 6,000 tonnes of greenhouse gas emissions.

In addition to this Brickworks continue research and development projects that are embedded into production across the Brickworks Building Product operations including new products and efficiency gains. The relevant projects for Austral Bricks are described below.

Thermal mass

Provide leading research on passive thermal design enabling reduced lifetime energy use. We have invested in updating critical thermal mass research demonstrating benefits from thermal mass with the University of Newcastle

Light-weighting and higher recycled content

Brickworks' dedication to excellence means our products are fired in some of the leading energy-efficient kilns, with ongoing research to reduce brick weight through enhanced core percentage and innovative core

¹ A Study of the Thermal Performance of Australian Housing, University of Newcastle, 2011-2017. Study is currently being updated to include thermal research in 7 Star Home designs under the Nationwide House Energy Rating Scheme.

patterns, resulting in savings on clay, energy, fuel, and ease for bricklayers.

Using enhanced clay materials, our Queensland and NSW brick factories have increased core percentage for some products from 27-28% to 41%, reducing material use by 18%, cutting energy consumption, and maintaining/improving product quality while increasing kiln capacity. These gains are being rolled out across selected Austral Brick products.

Raw material optimisation

Optimal raw material mixes can reduce embodied carbon or process heat demands. Brickworks commitment to innovation continues to be rewarded by significant developments in energy savings and premium product development. Ongoing research into traditional clay materials has provided us with a deep understanding of their physical and chemical properties. This knowledge allows us to successfully develop raw material optimised mixes which require less process heat energy, reducing the embodied carbon of bricks.

Emissions reduction actions

Austral Bricks Tasmania's FY2024 maintenance program focused on replacing kiln panels, burner ports, and the sawdust drying facilities to reduce thermal leakage and improve energy efficiency. Alongside this, several unquantified improvements were made, including

- light weighting bricks by increasing core percentage, leading to savings in clay, energy, and transport fuel and
- trialling an electric forklift.

Austral Bricks Tasmania has additional plans to investigate reducing packaging, sourcing raw materials closer to the plant, and optimising transport routes to further boost emission efficiencies.

5.EMISSIONS SUMMARY

Emissions over time

Brickworks has completed a comprehensive life cycle assessment for our Longford Plant. This assessment covers all bricks and pavers made at the Longford plant and covers the emissions boundary as previously described.

Emissions since base year						
		Total tCO ₂ -e	Percentage change in the emissions intensity per 000 SBE			
Base year:	2012-13	3402				
Year 1:	2013-14	3668				
Year 2:	2014-15	3381				
Year 3:	2015-16	4832				
Year 4:	2016-17	5088				
Year 5:	2017-18	5932				
Year 6:	2018-19	5054				
Year 7:	2019-20	6656	100%			
Year 8:	2020-21	6188	99%			
Year 9:	2021-22	5467	86%			
Year 10:	2022-23	5334	93%			
Year 11:	2023-24	4940	90%			

Production numbers are confidential and therefore emission intensity has been expressed as a percentage change.

Significant changes in emissions

Total emissions for Austral Bricks (TAS) Pty Ltd decreased in the reporting year. This was mainly due to reduced emissions from transport to customers in FY2024.

Significant changes in emissions							
Attributable process	Previous year emissions (t CO ₂ -e)	Current year emissions (t CO ₂ -e)	Reason for change				
Transport of product to customer	1973	1726	Reduced transport of product				

Since 2013 the following changes in emissions have occurred:

- There has been an increase in natural gas usage following the introduction of sawdust drying
 equipment and burners to supplant coal as a fuel source in 2014. While these initiatives led to a
 rise in natural gas consumption, they concurrently reduced electricity and coal usage.
- Emissions from transportation to customers increased because of increased interstate transfers since 2013.
- Emissions from coal have decreased through the substitution of on-board coal with natural gasfired segments of the kiln.

- Electricity usage emissions decreased with various energy efficiency activities undertaken since
 2013. Details of these projects are outlined in each annual PDS.
- A minor increase in emissions due to the inclusion of calcination emissions from the firing of clay.

Use of Climate Active carbon neutral products, services, buildings or precincts

N/A

Emissions summary

Brickworks has undertaken an LCA for our total brick and paver production in Longford. These emissions include emissions from transport of bricks to clients by a delivery truck over 50 km. When determining the emissions associated with bricks supplied to a client or project, we use the actual mass of the bricks supplied and actual transport distance from plant to client to get an accurate carbon footprint for the consignment. Production numbers are confidential.

Note: in line with our NGER reporting, we have applied a location-based approach for electricity.

Life cycle stage / Attributable process / Emission source	tCO₂-e
Extraction of clay (diesel use)	28
Transport of clay to Longford (diesel use)	103
On-site energy: Longford plant electricity use	508
Truck vehicle fleet (diesel); on-site vehicles	158
On-site energy: Kiln fuel (natural gas) use	1543
On-site energy: Kiln fuel (saw dust) use	143
Calcination of clay	137
Body additive (char / coal and vegetable oil) use	83
Transport of products to customer	1726
Manual application and manual maintenance/cleaning	0
Transport of bricks to end-of-life landfill	385
Bricks in landfill	0
Uplift for packaging and other overhead	78
Uplift for additives not reported under NGER	48
Attributable emissions (tCO ₂ -e)	4940

Product offset liability					
Emissions intensity per functional unit (average t CO2a/000CRE)?	Commercial-in-				
Emissions intensity per functional unit (average t CO2e/000SBE) ²	Confidence				
Emissions intensity per functional unit including uplift factors	Uplifts included above				
North on affirmation of our the account for the acception	Commercial-in-				
Number of functional units covered by the certification	Confidence				
Total emissions (tCO₂-e) to be offset	4940				

_

² Emission intensity per functional unit is based on the actual data of products sold and transport to the project site.

6.CARBON OFFSETS

Eligible offsets retirement summary

Offsets retired for Climate Active certification

³ These offsets have been transferred from the Brickworks Building Products Opt In PDS. No credits were used as part of the Opt In PDS, therefore no double counting of these units has occurred.

Co-benefits

Tasmanian Native Forest Protection REDD Forests:

The REDD Forests project equates to 30% of Austral Bricks (Tas) offsets for financial year 2023. Tasmania is internationally recognised for its native forest, endemic species and significant biological diversity. However, significant tracts of native forest are still being logged or are scheduled for logging to make way for pasture or other agricultural use.

These projects minimise greenhouse gas emissions by preventing the release of carbon stored in the trees, which would otherwise occur through the logging, processing and use of the timber. The carbon credits provide a means for landholders to pursue a new business model, generating revenue from protecting trees rather than clearing them.

<u>Thaa-Nguigarr Carbon Project, Qld</u> (ERF109636) is an early dry season Savanna burning project aimed at reducing late dry season wildfires, and therefore reducing carbon emissions.

Balkanu Cape York Development Corporation Pty Ltd is the project proponent in association with the land holder Poonko Aboriginal Corporation and the Prescribed Body Corporate Thaa-Nguigarr. The project is carried out on Strathgordon Station covering an area of 118,000 hectares.

The project was declared by the Clean Energy Regulator on 20 December 2016. A fire management program was instigated in 2016 and continues to the present. This mitigates wildfire risk, conserves vegetation and animal species, protects wetlands and controls weeds. Burning takes place in the Early Dry Season each year, before the start date of the Late Dry Season of the 1st August. The operations are conducted by Traditional Owners and other staff as required.

The revenue from the sale of the carbon credits obtained enables Traditional Owners to support their landholding obligations and cultural and environmental aspirations for the property.

International Units: Indian Solar:

Indian wind and solar VCUs comprise the remaining 70% of carbon offsets. Solar and wind projects provide emission free, affordable energy to the Indian electricity grid. Our procurement of Indian VCUs supports the transition away from India's fossil fueled dominated energy mix, and provides co-benefits including cleaner air, good work opportunities and improved energy equity.

International Units: Siam Cement Biomass Project

Thailand heavily relies on the burning of fossil fuels for its cement industries, even though cement production is an emission-intensive activity – making up an estimated 5% of all global man-made CO₂ emissions. New infrastructure now enables the five cement manufacturing plants involved in this project to use alternative fuels and biomass residue, including rice husks, wood processing residues and other agricultural waste. As a result, they have been able to reduce their dependence on fossil fuels such as the coal and lignite fuel mixes, they previously used in their kilns.

This project funds a range of social and environmental programs including health clinics to service the neighboring communities, over 65,000 check dams for upstream forest conservation, school scholarships,

mobile health clinics and the development of small-scale local industries. Farmers also now profit from a supplementary income and additional jobs have been created thanks to the project's efficient supply chains and manufacturing processes for biomass fuels.

International Units: Crow Lake Wind Emissions Reduction Project

Crow Lake Wind is a 162 MW wind farm located near Chamberlain, South Dakota. The project generates emissions reductions by displacing grid connected sources.

7. RENEWABLE ENERGY CERTIFICATE (REC) SUMMARY

Renewable Energy Certificate (REC) Summary

N/A

APPENDIX A: ADDITIONAL INFORMATION

Additional information on Life Cycle Analysis

Product Description

Brickworks Limited (Brickworks) is one of the world's leading providers of building products. Austral Bricks, a subsidiary of Brickworks has been transformed from originally a New South Wales state based operation to a national organisation with manufacturing operations in NSW, Victoria, Tasmania, South Australia, Western Australia and Queensland. Austral Bricks manufactures and markets clay products such as bricks and pavers. The manufacturing process involves mining clay and shale and mechanically processing it prior to shaping and firing the bricks in kilns fueled predominately by natural gas.

Austral Bricks Longford, Tasmania operates a low carbon operation whereby the kiln is predominately fired by sawdust. It has manufactured carbon neutral bricks since 2013/14 under the Climate Active Standards. This public disclosure statement concerns all bricks manufactured at Austral Bricks Longford which are certified carbon neutral.

Austral Bricks Tasmania certifies all the clay products manufactured at the Longford plant as carbon neutral under the Climate Active program. The products made at Austral Bricks Longford include bricks and pavers:

- Bricks. Clay bricks are a common building material used predominantly for wall systems in residential buildings.
- 2. **Pavers**. Clay pavers are used for paving and landscaping in residential, commercial and industrial applications.

Bricks are used for several reasons:

- load-bearing capacity this makes bricks suitable for load bearing walls;
- aesthetics bricks are available in a large range of colours, tones and textures;
- durability bricks perform their function for the duration of the service life of the building; and
- bricks require relatively little maintenance and cleaning.

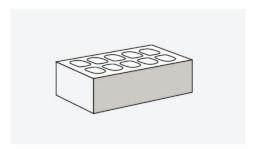

Pavers are similar in appearance and characteristics to bricks, although they are used for paving rather than wall applications.

Table 1 and Table 2 present examples of the products included in this certification.

Table 1: Typical brick product configurations (Source: Austral Bricks)

Brick shape and core hole configuration

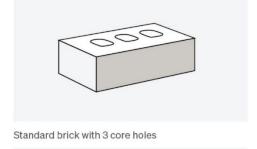

Examples - bricks in wall application

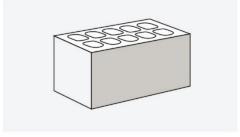

Standard brick with 10 core holes

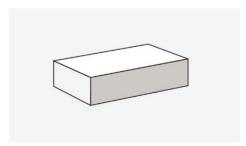

Twin brick

Table 2: Typical paver product configuration (Source: Austral Bricks)

Paver shape

Example - pavers in paving application

Classic paver (no core holes)

The functional unit for this certification is t CO2-e/ 1,000 Standard Brick Equivalents (SBEs) of bricks or pavers

Standard Brick Equivalent is a common unit of measurement across the clay brick industry for a brick. An SBE refers to the fired product and has the dimensions of 230x110x76mm. The products covered in this PDS come in a range of different sizes, which have been converted to SBEs.

The functional unit of SBE's has been built into the sites carbon calculator, to understand the amount of carbon associated with the lifecycle of each brick. The functional unit is not applicable to the carbon inventory as all products produced at Longford are offset.

Emissions Boundary

For each life cycle stage, attempts have been made to identify and quantify material flows, energy flows and emission sources. The inputs include materials, fuels and energy while the outputs include products, emissions and waste.

For the purposes of this certification, the embodied energy incorporated in the infrastructure (buildings, plant, equipment, roads, vehicles, etc.) associated with manufacturing bricks and pavers is excluded from the product system. Other capital goods (e.g. power lines) are excluded as well. This is due to the long lifetime of capital goods in the brick lifecycle and the expected impact of this exclusion on the footprint is small.

Austral Bricks has applied a cut-off limit for flows smaller than 1% of expected greenhouse gas emissions. This means we have estimated emissions based on past data, instead of collecting detailed information for these smaller emission sources for the current period. These are listed as non-quantified sources in the diagram hereafter.

Note: Mortar and/or other materials used to bond bricks in their application are excluded from the carbon footprint assessment. The reasons for this exclusion are:

- Brickworks does not supply the mortar to clients, and therefore has no control over the composition and quantity of mortar used.
- Furthermore, the bricks and pavers are used in a range of applications that have varying
 requirements regarding ancillary materials. Any attempt to capture these requirements
 within the scope of this certification would introduce additional uncertainty.

APPENDIX B: ELECTRICITY SUMMARY

N/A

APPENDIX C: INSIDE EMISSIONS BOUNDARY

Non-quantified emission sources

The following emissions sources have been assessed as attributable, are captured within the emissions boundary, but are not measured (quantified) in the carbon inventory. These emissions are accounted for through an uplift factor. They have been non-quantified due to <u>one</u> of the following reasons:

- 1. Immaterial <1% for individual items and no more than 5% collectively
- 2. Cost effective Quantification is not cost effective relative to the size of the emission but uplift applied.
- 3. <u>Data unavailable</u> Data is unavailable but uplift applied. A data management plan must be put in place to provide data within 5 years.
- 4. Maintenance Initial emissions non-quantified but repairs and replacements quantified.

Relevant non-quantified emission sources	Justification reason
Additives not reported under NGER	Data unavailable (but uplift applied & data plan in place)
Packaging	Data unavailable (but uplift applied & data plan in place)
Waste	Immaterial
Water use and wastewater treatment	Immaterial

Excluded emission sources

Attributable emissions sources can be excluded from the carbon inventory, but still considered as part of the emissions boundary if they meet **all three of the below criteria**. An uplift factor may not necessarily be applied.

- 1. A data gap exists because primary or secondary data cannot be collected (no actual data).
- 2. Extrapolated and proxy data cannot be determined to fill the data gap (no projected data).
- 3. An estimation determines the emissions from the process to be **immaterial**).

	No actual data	No projected data	Immaterial
Land use and land use change emission	Yes	Yes	Yes
Demolition of the structure / emissions from equipment	Yes	Yes	Yes

Data management plan for non-quantified sources

The data management plan below outlines how more rigorous quantification can be achieved for material (greater than 1%) non-quantified emission sources.

The following items meet the condition of 'attributable' but are below the cut-off and are considered non-quantified. We have applied uplift factors based on the previous LCA for bricks manufactured in Longford.

- Additives not reported under National Greenhouse and Energy Reporting (NGER) Act 2007: We use a large range of additives to give each brick its unique properties (colour, glaze, etc.). Additives that are energy carriers (e.g. char, vegetable oils, starch-based additives) are reported under our NGER obligations and have been included based on actual use and emission factors. The remaining additives are mainly minerals (e.g. iron oxide, manganese oxide) or frits (glass containing colorant). Using conservative literature data applicable to additives used at Longford (Tas), based on Brickworks' LCA FY19, the weighted average emission factor was established as 214 kg CO2e/t of additives not already reported under NGER. This equates to 1.4 kg CO2e per tonne of bricks. This factor has been applied as the uplift factor across all products.
- Packaging, waste to landfill, water use and wastewater treatment: Based on Brickworks' LCA
 FY19, the total of greenhouse gas emissions associated with these sources added up to 2.2 kg
 CO2e per tonne of bricks. This factor has been applied as the uplift factor across all products.

Cumulatively, the uplift factors account for 2% of the Longford products' life cycle emissions.

APPENDIX D: OUTSIDE EMISSION BOUNDARY

Non-attributable emissions have been assessed as not attributable to a product or service (do not carry, make or become the product/service) and are therefore not part of the carbon neutral claim. To be deemed attributable, an emission must meet two of the five relevance criteria. Emissions which only meet one condition of the relevance test can be assessed as non-attributable and therefore are outside the carbon neutral claim. Non-attributable emissions are detailed below.

- <u>Size</u> The emissions from a particular source are likely to be large relative to other attributable emissions.
- Influence The responsible entity could influence emissions reduction from a particular source.
- 3. **Risk** The emissions from a particular source contribute to the responsible entity's greenhouse gas risk exposure.
- 4. <u>Stakeholders</u> The emissions from a particular source are deemed relevant by key stakeholders.
- Outsourcing The emissions are from outsourced activities that were previously undertaken by the
 responsible entity or from outsourced activities that are typically undertaken within the boundary for
 comparable products or services.

Non-attributable emissions sources summary

Emission sources tested for relevance	Size	Influence	Risk	Stakeholders	Outsourcing	Justification
Head Office business travel	N	Y	N	N	N	Corporate business travel emissions (at 738-780 Wallgrove Rd, Horsley Park NSW) have been excluded from the boundary, as these emission sources are not attributable to the products.
Head Office energy use	N	Υ	N	N	N	Corporate head office energy use emissions (at 738-780 Wallgrove Rd, Horsley Park NSW) have been excluded from the boundary, as these emission sources are not attributable to the products.
Capital goods	N	Y	N	N	N	The embodied emissions of capital goods (plant equipment, buildings, infrastructure) are considered non-attributable to the product. This is consistent with industry standard LCAs for construction products, as outlined in the Product Category Rules (PCR) of the International EPD System and has been verified by the Registered Consultant that has compiled our inventory.
